

Title: FitRater

Description:

FitRater is a fashion focused iOS application that allows users to upload their outfits and receive a generated rating with feedback. This app helps outfits evaluation fun while also letting users have an app to track their outfits. Users post a photo while also describing the context of their outfit by selecting an occasion, outfit type, weather, accessories, and more style details before submitting their fit for review for it to feel intentional and not random. Alerts are also used around the app in different cases with delete buttons, invalid email/password scenarios, and more.

The app includes secure authentication using Firebase with email and password. The app uses a login and registration using email and password authentication. After logging in, users navigate between 4 sections through tab view on the bottom of the screen: rate, history, profile, and settings. The rate section lets users have their outfit rated by inputting outfit details with segment controls, dropdown pickers, and toggles. Users must upload a photo before submitting their outfit.

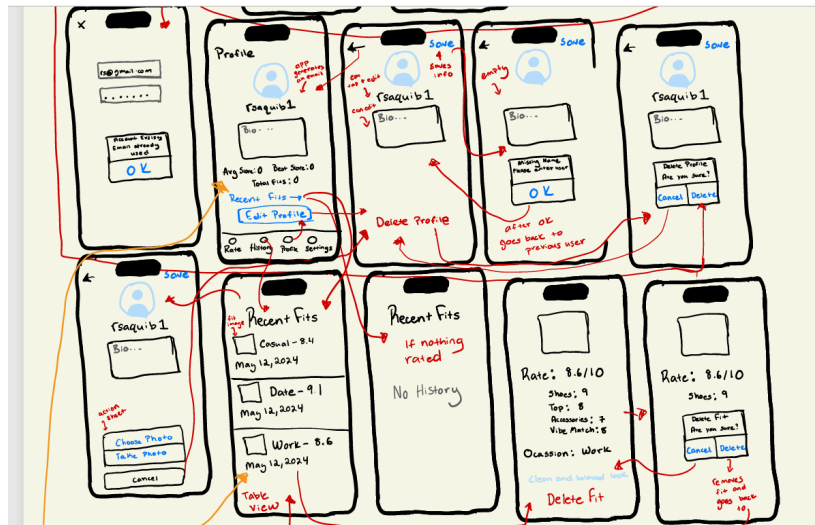

After pressing "Rate My Fit", a short animation with bouncing dots and a blurred image preview appears before the final score is revealed. The result screen shows overall rating, a breakdown of category scores, and a generated comment. Users may save their results to view them later in the history tab. The history tab shows all the saved fits in a table view and can be interacted with to see more details or have the option to delete the fit.

The profile screen lets users manage their username, bio, profile picture, and history tab. Users can delete their profile if needed. The settings screen allows customization of appearances like a light or dark theme, rating strictness, etc. FitRater is designed to be visually engaging and clean with interactive components for users. The app is built for people who are into fashion and want rating/advice, for fun, and for a fit diary as well. FitRater also has a logo of a simple pink bow for a visual appeal.

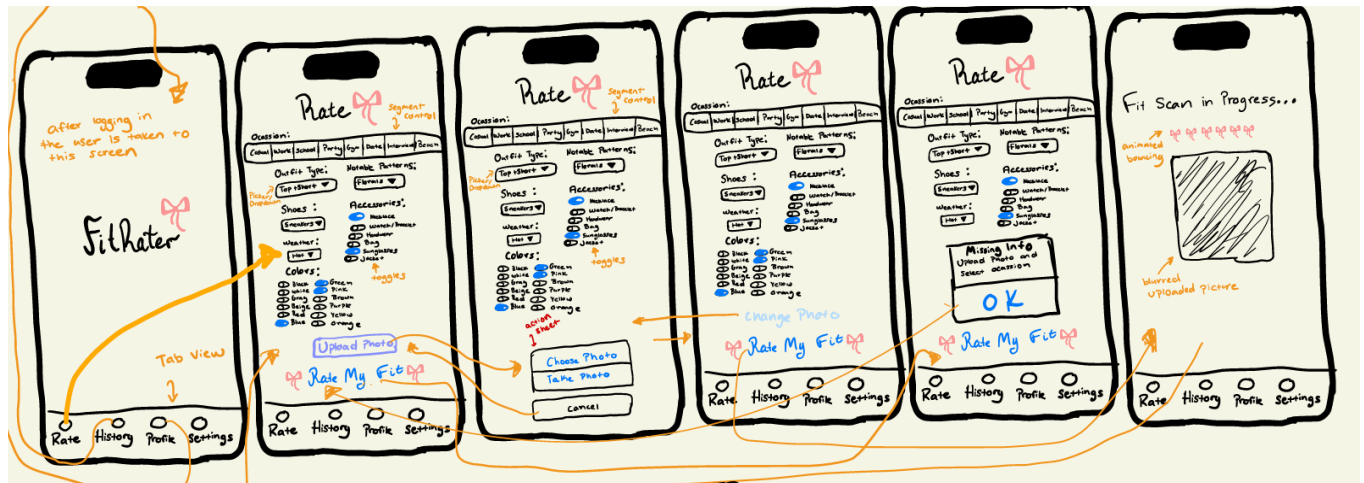

Operation Description:

When the application first launches the user is presented with the FitRater home screen. From this screen, the user can select either Login or SignUp. If the user selects Log In, they are taken to a login screen where they must enter their email and password. If only one field is completed, an alert appears prompting the user to enter both fields. If invalid credentials are entered, another alert appears informing the user that the login attempt failed. Pressing "OK" returns the user to the login screen. If the user presses Sign Up, they are taken to the registration screen where they enter an email and password. If the email is already associated with an existing account (validated through Firebase), an alert appears notifying the user. After successfully registering, the user returns to the login screen and can proceed to log in.

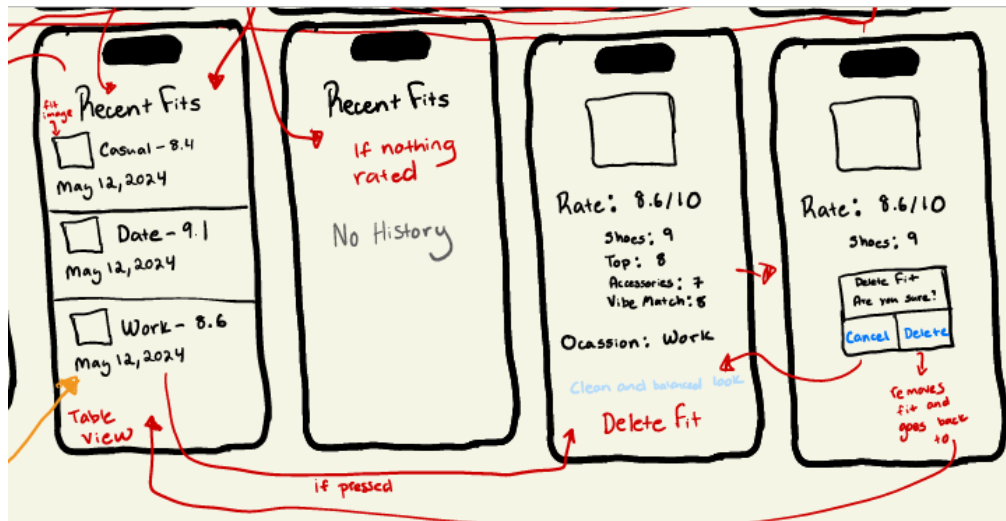

The profile screen shows the user's profile picture, username, bio, rating statistics including average score, best score, and total fits submitted, and recent fits history. The recent fits history button takes the user to the history tab just like the history on tab view at the bottom does. If the user has not rated any outfits yet, these statistics default to zero. Selecting Edit Profile allows the user to modify their username and bio. If the username field is left blank and the user attempts to save changes, an alert appears. The profile picture can be changed by tapping the image icon, which presents an action sheet allowing the user to either take a photo or select one from their photo library. user also has the option to delete their profile. Selecting Delete Profile triggers a confirmation alert before permanently removing the account.

When the user presses on the rate tab, it opens the outfit submission interface. The user selects an occasion using a segmented control. Additional details such as outfit type, weather, shoes, and notable patterns are selected using dropdown pickers. Accessories and colors are chosen using toggle controls. The user must upload a photo and an occasion before submitting an outfit. Tapping the Upload Photo button presents an action sheet with options to take a photo or choose one from the photo library. After a photo is selected, the button changes to "Change Photo" in case the user wants to update it. If the user presses "Rate My Fit" without selecting an occasion or uploading a photo, an alert appears indicating that required information is missing. After pressing Rate My Fit, a short animation screen appears with bouncing dots and a blurred preview of the uploaded image. Once the animation completes, the results screen displays the full image, overall score, a breakdown of category ratings, and a generated comment. The user may either save the result to history or rate another outfit.

The history tab shows previously saved outfits in a table view format. Each row includes a thumbnail image, the selected occasion, the rating score, and the date submitted. If no outfits have been saved, a default “No History” message is displayed. Selecting a saved outfit opens a detailed view that shows the full image, rating breakdown, occasion, and generated comment. The user can delete a saved fit from this screen, which triggers a confirmation alert before removal.

The setting screen allows the user to adjust the application. Users can switch between Light and Dark themes using a segmented control. Haptic feedback can be enabled or disabled using a toggle. A strictness slider allows the user to adjust how strict the rating system behaves. The save button lets the user save their updated setting preferences. The user may also sign out from this screen, which returns them to the initial login screen.
